

One head routes color information by the queried person

Change only the person in the question; keep the records, colors and perturbation fixed.

32 matched query swaps; all show stronger Alice-record attention and payload effect when Alice is queried.

Payload test: $\pm 0.1 \times$ native color contrast, applied to Alice's old and new record values at one head invocation.

Effect = $[\text{color log odds}(+\text{perturbation}) - \text{color log odds}(-\text{perturbation})] / 2$. Full native downstream runs.
